

Five Solutions of Smart Logistics

1、 Intelligent Warehouse Solution

Using the integrated logistics design concept, through design planning to realize the connection of automation equipment and the cooperation of information system, realize logistics intelligent warehousing, picking and inventory management, and improve space utilization and storage efficiency.

The independently developed WMS, WCS and MES are connected with the upper system, which can realize the digitization and informatization of production and storage equipment.

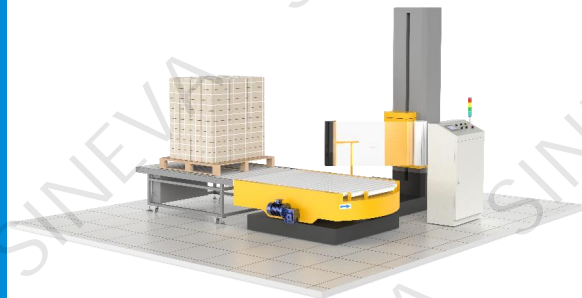

2、 Intelligent Distribution Solution

Meet the needs of customers in terms of material turnover quantity, supply mode, equipment utilization rate and logistics route, so as to standardize the operation of the distribution system, speed up the response, integrate the functions and simplify the manpower.

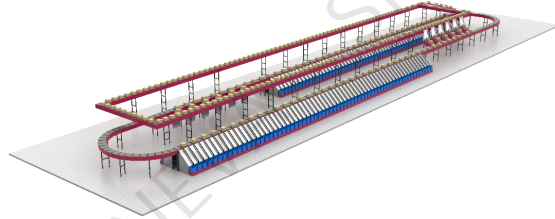

3、 Automatic Tape Wrapping Solution

The full-automatic tape wrapping system integrates tape wrapping, and the whole process is unmanned. It can be used in tobacco, papermaking, electronics, auto parts, food, battery and other industries. It can improve the logistics efficiency, reduce the loss in transportation and the packaging cost.

4、 Automatic Sorting Solution

According to customer order requirements or distribution plan, it can pick out goods from their storage or other locations quickly and accurately, and classify and concentrate in a certain way. The sorting operation is basically unmanned, can reduce the labor intensity of staff and improve the utilization rate of staff. It is able to sort goods continuously and in large quantities, is not subject to climate, time, human strength and other restrictions, and the error rate is very low.

5、 Automatic Palletizing Solution

It is a mechanical and electrical integration high-tech product, can stack bags, rubber blocks, boxes and other products according to the required grouping method and number of layers. The optimized design keeps the stack tight and neat.
